

I strongly believe in net neutrality. I believe that when I pay for access to the internet I am purchasing bandwidth to use as my liking. In my current location, I only have one company offering broadband. While you may think I have access to more because of my zip code, I only have access to one. If this company is given the freedom to slow down certain types of traffic, I cannot migrate to another company for high speed access. The market doesn't offer enough competition. If the company decides to restricts encrypted traffic, I can not do my job remotely.
